“Basic behavioural triage and first aid”

Sandra Nicholson, VICAS 2016, Presentation 1 abstract/summary

Responsibilities of vet nurse in behavioural issues

When a pet has behavioural issues, the client often seeks advice from many different sources before approaching the veterinary practice for advice. This may be because they are not aware that veterinary staff can assist with behavioural problems (Martin *et al.*, 2014). In order to create awareness of the role of veterinary practice staff in managing animal behaviour, it is important that behaviour is discussed from the client's first visit to the practice and then routinely throughout the animal's life (Martin *et al.*, 2014). However, many veterinary personnel are uncomfortable with giving advice on behavioural problems. As members of a caring profession, staff may hold very high expectations of themselves, translating into an “all or nothing” approach to behaviour. To protect animal welfare, it is important to readjust these self-expectations. In first-opinion practice, what roles and responsibilities can veterinary nurses assume in behavioural management? Veterinary personnel have a central role in preventing behavioural problems through the provision of advice and support and the running of “puppy parties” (Luescher *et al.*, 2007; Landsberg *et al.*, 2008). When behavioural problems occur, it is imperative to determine their severity, in order to provide advice and/or refer to the appropriate person (Behavioural triage) (Luescher *et al.*, 2007; Landsberg *et al.*, 2008). In addition, it is essential to provide interim management advice for animals with behavioural issues, in order to prevent the problem from worsening and to protect the animal and others from harm (Behavioural first aid) (Luescher *et al.*, 2007; Landsberg *et al.*, 2008). It is not necessary to perform behaviour counselling or behaviour modification. Indeed, it would be unwise to attempt this without having received supplementary training in this area. In addition, behaviour counselling requires a heavy time input, which makes it impractical for many veterinary businesses to offer.

Behavioural triage and First aid

In order to accurately triage behavioural problems and provide “first aid” advice, a capsule history should be taken. The client should be asked to describe the problem in detail (Seibert and Landsberg, 2008). From this, the severity, context, triggers and functions of the behaviour can be determined (Seibert and Landsberg, 2008). It is also important to establish how long the problem has existed and how frequently the behaviour occurs, as this can influence the success of intervention (Martin *et al.*, 2014). Also, the client should be asked how they feel about the problem, as this can give an indication of the urgency of the issue (Martin *et al.*, 2014). Any existing health problems and current medications (including non-prescription items) must be identified and the animal referred for a health check (Seibert and Landsberg, 2008). It is helpful to categorise the problem as a normal but misunderstood behaviour, a training issue, or a true pathological behaviour. For normal behaviour, education will be required (Landsberg *et al.*, 2008). Unruly behaviours may need referral to a reliable trainer (Landsberg *et al.*, 2008). However, pathological behaviours will require referral to a suitably qualified and experienced behaviourist or veterinary behaviourist (Landsberg *et al.*,

2008). Referral to a behaviourist may also be needed if there is strain on the human-animal relationship, risk of injury, an inability to avoid triggers/contexts, or high levels of animal stress (Martin *et al.*, 2014).

Due to the complexity of the cases and/or their associated risks, issues involving aggression, anxiety, fear/phobia, persistent barking or compulsive behaviour should be referred to a behaviourist. For behavioural cases awaiting referral, there are a number of recommendations that can be made. Firstly, it is crucial to avoid the target and triggering context(s) (Horwitz, 2008; Martin *et al.*, 2014). This safeguards all individuals involved and will prevent the behaviour from worsening (Horwitz, 2008). Positive punishment should be stopped, as this can increase stress and worsen behavioural problems (Martin *et al.*, 2014). However, it is inadvisable to reward undesirable behaviour. Conversely, remind your client to reward desirable behaviours. Animal stress/anxiety should be reduced, where possible. Finally, environmental changes or changes in routine may be implemented to manage the problem behaviour.

Conclusions

Veterinary nurses have an active role to play in the prevention of behavioural problems and the first response to behavioural issues. The severity of behavioural problems should be determined and the case should be referred appropriately, if needed. While awaiting referral, advice on maintaining safety and managing the animal can be extremely beneficial.
